

Express JS is open source software that is licensed under MIT license. This library provides a way to automatically parse http requests. For phase 1, all I'm using this for is serving html, css, and javascript files. The copyright doesn't impose any limitation on how we use express.

<https://github.com/expressjs/express/blob/master/lib/application.js#L616>

Above is the part of the code that creates the http server. Kinda the same way we create tcp server.

[https://www.w3schools.com/nodejs/met\\_http\\_createserver.asp](https://www.w3schools.com/nodejs/met_http_createserver.asp)

The above is what express called to start the server.

<https://github.com/expressjs/express/blob/master/lib/request.js#L467>

The code above is what we used to tell express what to serve from a certain http request. It basically caches the html, css, js files and just serve it when requested.
